bronchodilating agent. nucleic Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to acids associated with lung airway or lung dysfunction,

Claim 15; SEQ ID NO 7957; 763pp; English.

containing the content of the many variables and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the antice to prevent the hypertension of the antice to t oligonuclectides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) recepto surfactant depletion or hyposecretion, when administered to a mammal. the oligonucleotides into products that free adenosine in e.g., lung, brain, heart, kidney, etc, tissue environment thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system This invention describes a novel composition (a) a first active lung, nt any unwanted effects due to it receptors, agent, 6

                                                      Ś
                                                                                                                                                                                                                                                                                         The invention relates to a novel antisense compound of 8-80 nucleobases CC in length targeted to, and which specifically hybridizes with, a nucleic cald molecule encoding transforming growth factor (TGF)-beta 2, and CC inhibits the expression of TGF-beta 2. The invention further relates to: CC a compound 8-80 nucleobases in length that specifically hybridizes with CC at least an 8-nucleobases portion of an active site on a nucleic acid compound encoding TGF-beta 2; a composition comprising the compound and a CC carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or tissues by contacting the cells or tissues with the compound so that CC expression of TGF-beta 2 is inhibited; treating an animal having a CC disease or condition associated with TGF-beta 2 by administering to the compound a therapeutic or prophylactic amount of the compound so that CC expression of TGF-beta 2 is inhibited; and screening an antisense compound. The antisense compound has cytostatic, nootropic, composition and methods are useful for treating a disease or condition associated with TGF-beta 2, such as a hyperproliferative disorder e.g. CC cancer, a neurodegenerative disorder, or a disease or condition involving CC represents an antisense oligonucleotide of the invention.

The invention relates to a novel antisense compound of 8-80 nucleobases CC in length targeted to, and which specifically hybridizes with, a nucleic CC acid molecule encoding transforming growth factor (TGF)-beta 2, and CC inhibits the expression of TGF-beta 2. The invention further relates to: CC a compound 8-80 nucleobases in length that specifically hybridizes with CC at least an 8-nucleobase portion of an active site on a nucleic acid CC molecule encoding TGF-beta 2; a composition comprising the compound and a CC carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or tissues by contacting the cells or tissues with the compound so that CC expression of TGF-beta 2 is inhibited; treating an animal having a CC disease or condition associated with TGF-beta 2 by administering to the CC animal a therapeutic or prophylactic amount of the compound so that CC expression of TGF-beta 2 is inhibited; and screening an antisense compound. The antisense compound has cytostatic, noctropic, composition and methods are useful for treating a disease or condition conservative disorder, or a disease or condition involving cancer, a neurodegenerative disorder, or a disease or condition involving concerts a preferred target DNA region of TGF-beta 2 of the invention.

                                                                                                                                                                                                                                                                                                                      뭐
                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel antisense compound of 8-80 nucleobases in length targeted to, and which specifically hybridizes with, a nucleic acid molecule encoding transforming growth factor (TGF) beta 2, and cid inhibits the expression of TGF-beta 2. The invention further relates to: a compound 8-80 nucleobases in length that specifically hybridizes with at least an 8-nucleobase portion of an active site on a nucleoic acid molecule encoding TGF-beta 2; a composition comprising the compound and a carrier or diluent; inhibiting the expression of TGF-beta 2 is inhibited; treating an animal having a CC disease or condition associated with TGF-beta 2 by administering to the expression of TGF-beta 2 is inhibited; treating an animal having a CC disease or condition associated with TGF-beta 2 by administering to the capression of TGF-beta 2 is inhibited; and screening an antisense compound. The antisense compound as cypostatic, nootropic,

                                                                                                                                                                                                                                                                                                                    Sequence 20
                                                                                                                                                                                                                                                                                                                                                    neuroprotective, and immunosuppressive activities. The compound, composition and methods are useful for treating a disease or condition associated with TGF-beta 2, such as a hyperproliferative disorder e.g. cancer, a neurodegenerative disorder, or a disease or condition involving hyperactivation of an immune response. This polynucleotide sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 15; SEQ ID NO 88; 135pp; English.

Human PPP3CB DNA antisense oligonucleotide #65.

```
acid molecule encoding transforming growth factor (TGF)-beta 2, and CC inhibits the expression of TGF-beta 2. The invention further relates to: CC an compound 8-80 nucleobases in length that specifically hybridizes with CC at least an 8-nucleobase portion of an active site on a nucleic acid compound encoding TGF-beta 2; a composition comprising the compound and a corrier or diluent; inhibiting the expression of TGF-beta 2 in cells or tissues by contacting the cells or tissues with the compound so that compression of TGF-beta 2 is inhibited; treating an animal having a compression of TGF-beta 2 is inhibited; treating an animal having a companial a therapeutic or prophylactic amount of the compound so that compound and attracepture or prophylactic amount of the compound, compound as condition and methods are useful for treating a disease or condition composition and methods are useful for treating a disease or condition associated with TGF-beta 2, such as a hyperproliferative disorder e.g. cascoiated with TGF-beta 3, such as a hyperproliferative disorder e.g. cascoiated with TGF-beta 2, such as a hyperproliferative disorder e.g. cascoiated with TGF-beta 3, such as a hyperproliferative disorder e.g. cascoiated with TGF-beta 2, such as a hyperproliferative disorder e.g. cascoiated with TGF-beta 3, such as a hyperproliferative disorder e.g. cascoiated with TGF-beta 2, such as a hyperproliferative disorder e.g. cascoiated with TGF-beta 3, such as a hyperproliferative disorder e.g. cascoiated with TGF-beta 2, such as a hyperproliferative disorder e.g. cascoiated with TGF-beta 2, such as a hyperproliferative disorder e.g. cascoiated with TGF-beta 2, such as a hyperproliferative disorder e.g. cascoiated with TGF-beta 2, such as a hyperproliferative disorder e.g. cascoiated with TGF-beta 2, such as a hyperproliferative disorder e.g. cascoiated with TGF-beta 2, such as a hyperproliferative disorder e.g. cascoiated with TGF-beta 2, such as a hyperproliferative disorder e.g. cascoiated with TGF-beta 2, such as a hyperprolif

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an antisense oligonucleotide targeted to a nucleic acid encoding the human PPP3CB polypeptide and inhibits expression of the PPP3CB polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense oligonucleotides are useful for inhibiting expression of the PPP3CB polypeptide and in preparation of a composition for treating autoimmune disorders or Alzheimer's disease. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding PPP3CB, useful for treating an autoimmune disorder, or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    31-JUL-2002; 2002US-00210723.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an antisense oligonucleotide targeted to a nucleic acid encoding the human PPP3CB polypeptide and inhibits expression of the PPP3CB polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably phosphorothy sugar moiety, or at least one modified nucleobase 2'-O-methoxyethyl sugar moiety, or at least one modified a nucleobase comprising a 5-methyloytosine. The antisense oligonucleotides are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                comprising a 5-methyloytosine. The antisense oligonucleotides are usefu for inhibiting expression of the PPP3CB polypeptide and in preparation a composition for treating autoimmune disorders or Alzheimer's disease. This sequence represents an antisense oligonucleotide target region of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding PPP3CB, useful for treating an autoimmune disorder, or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Dean NM,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      interleukin; IL-4 receptor; IL-5 receptor; lung disease; airway inflammation; allergy; asthma; impeded respiration; cystic fibrosis; acute respiratory distress syndrome;

The method is useful for preventing or treating a complex complex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway obstruction. The present sequence represents an oligonucleotide of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0
```

The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. interleukin (II) 4 receptor, II-5 receptor or salts of the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease is

The present sequence represents an oligonucleotide of the
interleukin (II)-4 receptor, II-5 receptor or salts of the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway obstruction. The present sequence represents an oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     interleukin; IL-4 receptor; IL-5 receptor; lung disease; airway inflammation; allergy; asthma; impeded respiration; cystic fibrosis; acute respiratory distress syndrome; pulmonary hypertension; lung inflammation; bronchitis; oligonucleotide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Oligonucleotide associated to PDE4C #6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codons and introns of respiratory disease-relevant genes e.g., CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SXC
The present invention relates to an oligonucleotide anti-sense to e.g., cc initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-ecc enterleukin (II)-4 receptor, II-5 receptor or salts of the coligonucleotide and optionally surfactant operatively linked to the coligonucleotide and optionally surfactant operatively linked to the coligonucleotide. The method is useful for preventing or treating a cc respiratory or lung disease, which involves administering to the airways cf a subject an effective amount of an inhibitor. The oligonucleotide is cc useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is cc chosen from airway inflammation, allergy(ies), asthma, impeded cc respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (CODD), allergic rhinitis (AR), acute respiratory distress syndrome cc (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway construction. The present sequence represents an oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                    The present invention relates to an oligonucleotide anti-sense to e.g., CC initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-ec end of nucleic acid target comprising gene(s) chosen from e.g. CC end of nucleotide acid target comprising gene(s) chosen from e.g. CC coligonucleotide and optionally surfactant operatively linked to the coligonucleotide. The method is useful for preventing or treating a CC respiratory or lung disease, which involves administering to the airways co f a subject an effective amount of an inhibitor. The oligonucleotide is CC useful for production of a medicament for the prevention and/or treatment CC aregivatory or lung disease. The respiratory or lung disease is CC chosen from airway inflammation, allergy(ies), asthma, impeded CC respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiratory distress syndrome CC (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway CC obstruction. The present sequence represents an oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Best Local Similarity

                                                                                                                             This sequence represents a primer which was used in the method of the CC invention for diagnosing susceptibility to pereistence or progression of CC cervical intraepithelial neoplasia (CIN) in an individual suffering from CC the disease. The method comprises detecting an allelic deletion in one or CC (progesterone receptor), DLEC1 (deleted in lung and oesophageal cancer 1) CC (progesterone receptor), DLEC1 (deleted in lung and oesophageal cancer 1) CC (progesterone receptor), DLEC1 (deleted in lung and oesophageal cancer 1) CC (progesterone receptor), DLEC1 (deleted in lung and oesophageal cancer 1) CC (progesterone receptor), DLEC1 (deleted in lung and oesophageal cancer 1) CC (progesterone receptor), DLEC1 (deleted in lung and oesophageal cancer 1) CC (progesterone receptor), DLEC1 (deleted in lung and oesophageal cancer 1) CC (progesterone receptor), DLEC1 (deleted from proteins present in the samples CC (derived from non-dyskaryotic and dyskaryotic samples, respectively. The CC (primers, where each pair of primers is suitable for amplifying a CC (primers, where each pair of primers is suitable for amplifying a CC (primers, where each pair of primers is suitable for amplifying a CC (primers) protein selected from FNT3, where each CC (primers) agent is capable of distinguishing between the normal and allelic CC (primers) or DLEC1. The method is useful for diagnosing susceptibility to CC (primers) or protein selected from FNT7, PR, CC (primers) or DLEC1. The method is useful for diagnosing susceptibility to CC (primers) or protein selected from FNT7, PR, CC (primers) or DLEC1. The method is useful for diagnosing susceptibility to CC (primers) or protein selected from FNT7, PR, CC (primers) or DLEC1. The method is useful for diagnosing susceptibility to CC (primers) or DLEC1. The method is useful for diagnosing susceptibility to CC (primers) or DLEC1. The method is useful for diagnosing susceptibility to CC (primers) or DLEC1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 537

                                                                                                                                                                                                                                                                      This invention relates to a novel primers useful for synthesising full length cDNA molecules that encode human proteins. Specifically, it refers to secretory or membrane proteins that are potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, allycoproteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5' and 3' ends using the oligo-capping method. This oligonucleotide sequence is a human clone specific PCR primer used in an exemplification of the

The molecules of the invention demonstrate cyrosine kinase pathway. The molecules of the invention demonstrate cyrostatic, antiangiogenic, vasotropic and vulnerary activities and may be useful in the field of pharmacogenomics, in particular for determining drug sensitivity and in treating breast cancer, hypervascular diseases, anglogenesis and scars in wound healing. The current sequence is that of a human protein tyrosine kinase biomarker-related RT-PCR primer of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New predictor sets with a plurality of polynucleotides and/or polypeptides whose expression pattern predicts cell response to compound that modulates protein tyrosine kinase activity, useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Homo sapiens

                                                                                                                                                                                                                                                                                      mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antiarchritic, vasotropic, antihiflammatory, neuroprotective, nootropic, antiarchritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.

                                                            ADM14746 standard; DNA; 20
                                                                                                                                                                                                                                                              Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9034.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antiinflammatory, neuroprotective, nootropic, antianthritic, vasotropic, antiinflammatory, neuroprotective, nootropic, antianthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mpGES-1; mpGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; nootropic; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; ss.
                                                                                                                                                                                               The present sequence represents a chimeric antisense oligonucleotide targeted to human microscomal prostaglandin E2 synthase (mpGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense compound, having a sequence targeted to a nucleic acencoding mPGES-1, useful for preparing a composition for treating inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gierse JK

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ADM14277
The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding
                                                                                                                New antisense compound, having a sequence targeted to a nucleic acencoding mPGES-1, useful for preparing a composition for treating inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                               modified_base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a chimeric antisense oligonucleotide contargeted to human microsomal prostaglandin E2 synthase (mPGES-1). The chuman mPGES-1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) antisense compounds, cc having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding cc inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal cc having a disease or condition associated with mPGES-1. MPGES-1 chimeric cantisense oligonucleotides and antisense compounds have cytostatic, cantisense oligonucleotides and antisense compounds have cytostatic, contininflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can cc used as mPGES-1 inhibitors and in gene therapy. The antisense compound cc be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's classes, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or contraint or contr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

MeGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, cardiant, neuroprotective, and can phthalmological, immunomodulatory and cardiovascular activities, and can be used as meGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or disease, cartivities, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
               chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase; mPGES-1; mCGES-1; motidiabetic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; antiinflammatory; neuroprotective; antiarthritic; vasotropic; ophthalmological;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense compound, having a sequence targeted to encoding mPGES-1, useful for preparing a composition f

                                                                                                                                                                                                                                                        The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. Chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidabetic, immunomodulator, cardiant, neuroprotective,

                                                                                                                           The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPCES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9334.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cycostatic, antisense oligonucleotides and antisense compounds have cycostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    934.3. The present invention also describes: (1) antisense compounds, 934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mpGES-1. MpGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides, cardiant, neuroprotective, cardiant, neuroprotective, on antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, isohaemia or reperfusion injury, or
                                                                                                                                                                                                                                                                                                                                                                                                  immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; nootropic; antiarthritic; vasotropic; ophthalmological; neuroprotective; nootropic; antiarthritic; vasotropic; ophthalmological;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           antidiabetic, immunomodulator, cardiant, neuroprotective, vasotropic, antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis diabetes, cancer, ischaemia or reperfusion injury, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 2004-305094/28
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  25-SEP-2003; 2003WO-US030374

                                                                                                                                                                                                                                                                                                                                                                                                       cc transported to numeral microscopies of the present invention also describes: (1) antisense compounds, cc 9q34.3. The present invention also describes: (1) antisense compounds, cc 9q34.3. The present invention also describes: (1) antisense compounds, cc metals, and the present invention of the nucleic acid encoding cc metals.) which specifically hybridise with the nucleic acid encoding cc metals. (2) a method of inhibiting the expression of cc metals or tissues; and (3) a method of treating an animal cc maring a disease or condition associated with mecals. Mecals chimeric antisense coligonucleotides and antisense compounds have cytostatic, cantisinglammatory, neuroprotective, nootropic, antisinflammatory, neuroprotective, nootropic, antiathritic, vasotropic, composition associated with mecals. The antisense compound can be used as mecals. immunomodulatory and cardiovascular activities, and can be used for preparing a composition for treating a disease or condition associated with mecals. 1 e.g., inflammation, Alzheimer's condition associated with mecals. 1 e.g., inflammation, Alzheimer's content of the condition associated with mecals.
                                                                                                                                                                                                               Query Match

                                                                                                                                                                                   The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides and antisense compounds have cytostatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g. inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              25-SEP-2003; 2003WO-US030374.

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (II) -4 receptor, interleukin (II) compared to the from a gene encoding interleukin (II) -4 receptor, interleukin (II) compared to the first place by PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention compared to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the compound the first place and the first place are useful for reducing or inhibiting expression of a conjunctation and/or treatment of a respiratory or lung disease. The compound the first place are considered and compound the first place are considered and compound the first place are considered as a compound the first place and considered and compound the first place are considered as a compound the first place are considered as a compound the first place are considered as a compound the first place and compound the first place are considered as a compound the first place and compo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CCR1; CCR3; Botaxin-1; RANYES; MCP4; CD23; ICAM; VCAM; tryptase a; tryptase b; PDE4 A; PDE4 B; PDE4 C; PDE4 D; respiratory disease; lung disease; hyper-responsiveness; adenosine; adenosine A receptor; asthma; lung allergy; inflammation; inflammatory disease; airway inflammation; allergy; impeded respiration; cystic fibrosis; CF; airway inflammation; allergy; impeded respiration; cystic fibrosis; CF; chronic obstructive pulmonary disease; COPD; allergic rhinitis; acute respiratory distress syndrome; pulmonary hypertension;

respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A receptor(s), and/or asthma and/or lung allergies associated with inflammation or an inflammatory disease. The respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CP), chronic obstructive pulmonary disease (COPD), allergic rhinitis, acute respiratory distress syndrome, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction or bronchoconstriction. This sequence represents an oligonucleotide of the

                                                                                                                                                                                                                                          The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region codon, coding region, 5' or 3' intron-exon junction, intron or region codon, coding region, 5' end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (II)-4 receptor, interleukin (IL)-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C PDE4 D. The invention CC also relates to a method of screening a candidate compound that binds to come or more nucleic acid target(s) or expressed product(s), for the come or more nucleic acid target(s) or expressed product(s), for the come or more nucleic acid target(s) or expressed product(s), for the colligonucleotides are useful for reducing or inhibiting expression of a CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CC CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are CC tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are CC tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are CC tryptase b, and/or sthma and/or lovels of adenosine A CC and/or increased levels of, adenosine and/or levels of adenosine A CC and/or increased levels of, adenosine and/or levels of adenosine A CC and/or increased levels of, adenosine and/or levels of adenosine A CC and/or increased levels of, adenosine and/or levels of adenosine A CC and/or increased levels of, adenosine and/or levels of adenosine A CC and/or increased levels of, adenosine and/or levels of adenosine A CC and/or increased levels of, adenosine and/or levels of adenosine A CC and/or increased levels of, adenosine and/or levels of adenosine (COPD), consite of the constructive pulmonary disease (COPD), consite of the constructive pulmonary disease (COPD)

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (II)-4 receptor, interleukin (II) -5 receptor, CCR1, CCR3, Botaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention CC also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the CC one or more nucleic acid target(s) or expressed product(s), for the CC one or more nucleic acid target(s) or expressed product(s), for the CC oligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CC CCR1, CCR3, Botaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are cuseful for preventing or treating a respiratory or lung disease. The CC useful for preventing or treating a respiratory or lung disease. The CC useful for preventing or treating a respiratory or lung disease. The CC cand/or increased levels of, adenosine and/or levels of adenosine A conceptor(s), and/or asthma and/or lung allergies associated with CC inflammation or an inflammatory disease. The respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, CC allergic rhinitis, acute respiratory distress syndrome, pulmonary or increased (CPP), chronic obstructive pulmonary disease (COPD), allergic rhinitis, acute respiratory distress syndrome, pulmonary or lung disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel single or multiple target oligonuclectide anti-sense to e.g. Conitiation codon, intron of respiratory disease-relevant gene e.g. CORANTES, MCP4, useful for prophylaxis or treating respiratory disease

chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)

CC chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)

CC receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM,

CC tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention

CC also relates to a method of screening a candidate compound that binds to

CC one or more nucleic acid target(s) or expressed product(s), for the

CC one or more nucleic acid target(s) or expressed product(s), for the

CC oligonucleotides are useful for reducing or inhibiting expression of a

CC oligonucleotides are useful for reducing or inhibiting expression of a

CC oligonucleotides are useful for reducing or inhibiting expression of a

CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor,

CC CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a

CC tryptase b, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are

CC useful for preventing or treating a respiratory or lung disease. The

CC useful for preventing or treating a respiratory or lung disease. The

CC and/or increased levels of, adenosine and/or levels of adenosine A

CC receptor(s), and/or asthma and/or lung allergies associated with

CC inflammation or an inflammatory disease. The respiratory or lung disease

CC office therefore a company inflammation, allergy, asthma, impeded respiration,

CC crystic fibrosis (CF), chronic obstructive pulmonary disease (COPD),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CCR1; CCR3; Eotaxin-1; RANTES; MCP4; CD23; ICAM; VCAM; tryptase a; tryptase b; PDE4 A; PDE4 B; PDE4 C; PDE4 D; respiratory disease; lung disease; hyper-responsiveness; adenosine; adenosine A receptor; asthma; lung allergy; inflammation; inflammatory disease; airway inflammation; allergy; impeded respiration; cystic fibrosis; CF; chronic obstructive pulmonary disease; acute respiratory distress syndrome; pulmonary hypertension; lung inflammation; bronchitis; airway obstruction; bronchoconstriction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human oligonucleotide #1815
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       23-APR-2002; 2002WO-US013135.

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (II -5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PD24 A, PD24 B, PD24 C or PD24 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The oligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     asthma; lung allergy; inflammation; inflammatory disease; airway inflammation; allergy; impeded respiration; cystic fibrosis; CF; chronic obstructive pulmonary disease; COPD; allergic rhinitis; acute respiratory distress syndrome; pulmonary hypertension; lung inflammation; bronchitis; airway obstruction; bronchoconstriction.

The preventing or treating a respiratory variable provides to and/or increased levels of adenosine and/or levels of adenosine a receptor(s), and/or asthma and/or lung allergies associated with inflammation or an inflammatory disease. The respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary disease (CDPD), allergic rhinitis, acute respiratory distress syndrome, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction or bronchoconstriction. This sequence represents an oligonucleotide of the
                      The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I); and determining the length of the resulting amplicon(s). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or more PML; and prediagnosis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a disease-related gene, that are associated with a predisposition to
                                                                                                                                                                                                                                                                                                                                                                                                                                             Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining length of amplicons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Geldermann
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     09-AUG-2002; 2002DE-01036711
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                09-AUG-2002; 2002DE-01036711.

Also described are: inhibiting the expression of IAP-like in cells or tissues; screening for a modulator of IAP-like; a diagnostic method for identifying a disease state comprising identifying the presence of IAP-like in a sample using at least one of the primers selected from 2 sequences comprising SEQ ID NO. 5 or 6, or the probe comprising SEQ ID NO. 7; a kit or assay device comprising the compound; and treating an animal having a disease or condition associated with IAP-like. The compound is useful for modulating the expression of IAP-like, e.g. a hyperproliferative disorder. This sequence represents a human inhibitor of apoptosis (IAP)-like antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cytostatic; gene therapy; inhibitors of apoptosis-like; IAP-like; IAP-like modulator; IAP-like associated disorder; hyperproliferative disorder; human; antisense oligonucleotide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human inhibitor of apoptosis-like antisense oligonucleotide seqid 149.

New compound

targeted to

a nucleic acid molecule encoding inhibitors

e E

The primers AAV27964-V28086 are used to amplify ataxia telangiectasia (ATM) exons and their adjacent splice junction sites. These can be use as a method of detecting a mutation in the ATM gene by comparing the

PCR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes a compound 8-80 nucleobases in length targeted to compound encoding inhibitors of apoptosis (IAP)-like, compound specifically hybridises with the nucleic acid molecule encoding inhibitors of apoptosis (IAP)-like.

CC where the compound specifically hybridises with the nucleic acid molecule encoding IAP-like comprising 16000 bp (SEQ ID NO. 4) and inhibits the compound in the sequence comprision of the presence of IAP-like. Also described are: inhibiting the expression of EAP-like in a sample using state comprising identifying the presence of IAP-like in a sample using at least one of the primers comprising SEQ ID NO. 5 or 6, or the probe comprising SEQ ID NO. 7; a kit or assay device comprising the compound; and treating an animal having a disease or condition associated with IAP-CC and treating an animal having a disease or condition associated with IAP-CC it is also useful for diagnosing or treating diseases associated with CC expression of IAP-like, e.g. a hyperproliferative disorder. This sequence comprisors human inhibitor of apoptosis (IAP)-like antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 561
                            The present invention describes a restriction primer for eukaryotic short interspersed repeated sequences (SINE), which has one or more additional bases that are a mismatch to, or are unrelated to, the 3'-terminal end of the SINE. The annealing temperature of the primer to the NNA sequence is kept higher than the fusion temperature of the primer during polymerase chain reaction (PCR). The PCR fragments obtained are subjected to electrophoresis to obtain a fingerprint. By comparing the polymorphs from the electrophoresis band pattern, eukaryotic individuals are distinguished. The primer is used for amplifying a eukaryotic distinguished. The primer is used for amplifying a eukaryotic decoxyribonucleic acid (DNA) sequence, pinched between SINE sequences by polymerase chain reaction (PCR) fingerprinting. In particular it may be used individual identification of humans for medical and legal applications and ecological studies. NNA specimens in traces (approximately 10 ng in mass) can be used for individual discrimination of eukaryotes using the primer in a polymerase chain reaction (PCR).

ANZESI43 to ANZESI91 represent specifically claimed examples of primers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   products of amplification from a sample from a patient suspected of having an ATM mutation with a sample from a non-mutated ATM patient This method is especially useful for diagnosing ataxia telangiectasia in heterozygotes and can be used to locate the positions of the mutation. The diagnosis of ataxia telangiectasia in patients needing therapeutic radiation will prevent fatal radiation burns and the development of
                                                                                                                                                                                                                                                                                                                                                                                                      Restriction primer for distinguishing individuals with short interspersed repeated sequence of eukaryotes by restricted polymerase chain reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 JP2913035-B1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SS
                                                                                The present invention describes a restriction primer for eukaryotic short CC interspersed repeated sequences (SINE), which has one or more additional CC bases that are a mismatch to, or are unrelated to, the 3'-terminal end of CC the SINE. The annealing temperature of the primer to the DNA sequence is kept higher than the fusion temperature of the primer during polymerase CC chain reaction (PCR). The PCR fragments obtained are subjected to electrophoresis to obtain a fingerprint. By comparing the polymorphs from CC the electrophoresis band pattern, eukaryotic individuals are distinguished. The primer is used for amplifying a eukaryotic deoxyribonucleic acid (DNA) sequence, pinched between SINE sequences by CC oblymerase chain reaction (PCR) fingerprinting. In particular it may be used individual identification of humans for medical and legal capplications and ecological studies. DNA specimens in traces CC approximately 10 ng in mass) can be used for individual discrimination of eukaryotes using the primer in a polymerase chain reaction (PCR).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAZ25144 standard;
                                                                                                                                                                                                                                                                                  the electrophoresis band pattern, eukaryotic individuals are distinguished. The primer is used for amplifying a eukaryotic decayribonucleic acid (DNA) sequence, pinched between SINE sequences by polymerase chain reaction (PCR) fingerprinting. In particular it may be used individual identification of humans for medical and legal applications and ecological studies. DNA specimens in traces (approximately 10 ng in mass) can be used for individual discrimination of eukaryotes using the primer in a polymerase chain reaction (PCR). ARZ25143 to ARZ25191 represent specifically claimed examples of primers
                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a restriction primer for eukaryotic short interspersed repeated sequences (SINE), which has one or more additional bases that are a mismatch to, or are unrelated to, the 3'-terminal end of the SINE. The annealing temperature of the primer to the DNA sequence is kept higher than the fusion temperature of the primer during polymerase chain reaction (PCR). The PCR fragments obtained are subjected to electrophoresis to obtain a fingerprint. By comparing the polymorphs from electrophoresis to obtain a fingerprint. By comparing the polymorphs from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human short interspersed repetitive element PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             13-DEC-1999

                                                                                                                                                                                                                                                                                                                                        Creation relates to a novel isolated or recombinant nucleic acid sequence comprising an ANGE, CLLD8 or CLLD7 mRNA, or ANGE-CLD8, ANGE-CLLD8, CLLD7-CLLD8, or ANGE-CLLD8 or CLLD7, CLLD7-CLLD8, or ANGE-CLLD8 or CLLD7 mRNA, or ANGE-CLLD8, ANGE-CLCD8, ANGE-CLLD8 mrd and an activities: antiallergic, antiasthmatic, dermatological, contipyretic, and antiinflammatory. The nucleic acid sequences be used in gene therapy to treat disorders. The nucleic acid sequences care useful for screening agents that inhibit or enhance activity of an ange, CLLD8 or CLLD7 gene. The agent or antibody is useful for treating consecutives, allergic rhinitis or non-atopic asthma. The antibody is useful in an assay detecting or measuring the polypeptide in the sample. The host cell is useful for producing, regulating and analyzing the colypeptide. The splice variant of ANGE, CLLD8, or CLLD7 is useful for CL diagnosing an IgE-mediated disease, atopy, a form of atopic disease or con-atopic asthma, or predicting the severity, or predisposition to a client to the invention.
                                                                                                                                                                                                                                Matches 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel isolated or recombinant nucleic acid computed an ANGE, CLLD8 or CLLD7 mRNA, or ANGE-CLLD8, ANGE-CLLD8, CLLD7-CLLD8, or ANGE-CLLD8 or CLLD7 mRNA, or ANGE-CLLD8, ANGE-CLLD8 or CLLD7, CLLD7-CLLD8, or ANGE-CLLD8 or CLLD7 hybrid mRNA sequence, its complement, homologue or fragment. The novel nucleic acid sequences have the following activities: antiallergic, antiasthmatic, dermatological, cantipyretic, and antiinflammatory. The nucleic acid sequences are useful for screening agents that inhibit or enhance activity of an CC ANGE, CLLD8 or CLLD7 gene. The agent or antibody is useful for treating CC IgE-mediated diseases, such as asthma, atopy, hay fever, eczema, atopic CC dermatitis, allergic rhinitis or non-atopic asthma. The antibody is useful for producing, regulating and analyzing the colypeptide. The splice variant of ANGE, CLLD8, or CLLD7 is useful for CC diagnosing an IgE-mediated disease, atopy, a form of atopic disease or colion-atopic asthma, or predicting the severity, or predisposition to a colinease. This polynucleotide sequence represents an REN-34 SNP binding colinease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2003WO-US031874.
```

The invention relates to a method of designing primers for simultaneous C amplification of target DNA fragments in a single multiplex polymerase CC chain reaction by aligning a first primer and a second primer. The method CC comprises: (a) aligning a first primer and a second primer; and (b) CC selecting the first primer where the first primer at its 3' end does not contain four or more bases that are perfectly matching to the 3' end CC sequence of the first primer or a second primer, the 3' end cC second primer, the first primer at its 3' end does not contain seven or more bases that are perfectly matching CC second primer, the first primer at its 3' end does not contain seven or more bases that are perfectly matching CC first primer or the second primer; and the first primer at its 3' end does not contain eleven or more bases that are perfectly matching to a sequence anywhere of the first primer at its 3' end come not contain eleven or more bases that are perfectly matching except come mismatch to a sequence anywhere of the first primer or the second come mismatch to a sequence anywhere of the first primer or the second come mismatch to a sequence anywhere of the first primer or the second come mismatch to a sequence anywhere of the first primer or the second complification of target DNA fragments in a single multiplex polymerase contain eleven or more bases that are perfectly matching except chain reaction. It is also useful in the identification of multiple genes contain eleven or more bases that are perfectly matching enesic contains the studies in pharmacogenetic reactions, the genotyping genetic contains in a large population, the gene expression invertion. Sequence sequence corresponds to an example of a primer of the 21 BP; 4 A; 6 C; 6 G; 5 T; 0 U; 0 Other; invention.

The annealing temperature of the primer to the DNA sequence is kept higher than the fusion temperature of the primer during polymerase chain reaction (PCR). The PCR fragments obtained are subjected to electrophoresis to obtain a fingerprint. By comparing the polymorphs from the electrophoresis band pattern, eukaryotic individuals are distinguished. The primer is used for amplifying a eukaryotic deoxyribonucleic acid (DNA) sequence, pinched between SINE sequences by polymerase chain reaction (PCR) fingerprinting. In particular it may be used individual identification of humans for medical and legal applications and ecological studies. DNA specimens in traces applications and ecological studies. DNA specimens in traces (BCR).

ANZ25143 to ANZ25191 represent specifically claimed examples of primers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Restriction primer for distinguishing individuals with short interspersed repeated sequence of eukaryotes by restricted polymerase chain reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         28-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       JP2913035-B1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a restriction primer for eukaryotic short conterporated repeated sequences (SINE), which has one or more additional CD bases that are a mismatch to, or are unrelated to, the 3'-terminal end of CD the SINE. The annealing temperature of the primer to the DNA sequence is CD the SINE. The annealing temperature of the primer during polymerase CD chain reaction (PCR). The PCR fragments obtained are subjected to CD cleatrophoresis to obtain a fingerprint. By comparing the polymorphs from CD the electrophoresis band pattern, eukaryotic individuals are CD distinguished. The primer is used for amplifying a eukaryotic construction and ecclosical studies. DNA specimens SINE sequences by CD olymerase chain reaction (PCR) fingerprinting. In particular it may be used individual identification of humans for medical and legal CD (approximately 10 ng in mass) can be used for individual discrimination of eukaryotes using the primer in a polymerase chain reaction (PCR). ANZES143 to AAZES191 represent specifically claimed examples of primers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a restriction primer for eukaryotic short clinterspersed repeated sequences (SINE), which has one or more additional bases that are a mismatch to, or are unrelated to, the 3'-terminal end of the SINE. The annealing temperature of the primer to the DNA sequence is kept higher than the fusion temperature of the primer during polymerase chain reaction (PCR). The PCR fragments obtained are subjected to electrophoresis to obtain a fingerprint. By comparing the polymorphs from the electrophoresis band pattern, eukaryotic individuals are clistinguished. The primer is used for amplifying a eukaryotic deoxyribonucleic acid (DNA) sequence, pinched between SINE sequences by polymerase chain reaction (PCR) fingerprinting. In particular it may be used individual identification of humans for medical and legal clastions and ecological studies. DNA specimens in traces (approximately 10 ng in mass) can be used for individual discrimination of eukaryotes using the primer in a polymerase chain reaction (PCR). AA225143 to AA225143 to PCR) in the primer in a polymerase chain reaction form the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

Restriction primer

ion primer for distinguishing individuals with short interspersed sequence of eukaryotes by restricted polymerase chain reaction

WPI; 1999-583348/50

(NORQ) NORINSUISANSHO SUISANCHO YOSHOKU KENKYUSHOCHO

repeated

The present invention describes a restriction primer for eukaryotic short interspersed repeated sequences (SINE), which has one or more additional bases that are a mismatch to, or are unrelated to, the 3'-terminal end of the SINE. The annealing temperature of the primer to the DNA sequence is kept higher than the fusion temperature of the primer during polymerase chain reaction (PCR). The PCR fragments obtained are subjected to electrophoresis to obtain a fingerprint. By comparing the polymorphs from the electrophoresis band pattern, eukaryotic individuals are distinguished. The primer is used for amplifying a eukaryotic

```
bases that are a mismatch to, or are unrelated to, the 3'-terminal end of the SINE. The annealing temperature of the primer to the DNA sequence is kept higher than the fusion temperature of the primer during polymerase chain reaction (PCR). The PCR fragments obtained are subjected to electrophoresis to obtain a fingerprint. By comparing the polymorphs from the electrophoresis band pattern, eukaryotic individuals are distinguished. The primer is used for amplifying a eukaryotic deoxyribonucleic acid (DNA) sequence, pinched between SINE sequences by polymerase chain reaction (PCR) fingerprinting. In particular it may be used individual identification of humans for medical and legal applications and ecological studies. DNA specimens in traces (approximately 10 ng in mass) can be used for individual discrimination of eukaryotes using the primer in a polymerase chain reaction (PCR).

ARZ25193 to ARZ5191 represent specifically claimed examples of primers

In particular it may be used individual identification of humans for medical and legal applications and ecological studies. DNA specimens in traces applications and ecological studies bused for individual discrimination (Androximately 10 ng in mass) can be used for individual discrimination (PCR).
